

Project Overview – Activity coordinator application

The objective of the project is to develop an mobile Android application where people can plan and create leisure time activities and also join in on other people's activities. The activities are for example football, chess, dancing etc.

A user of this app can log into it and see what ongoing activities there are in the vicinity. The user can thereafter choose to join an activity of its preference or to search for interesting activities on the app. Our aim is to connect people as smoothly as possible.

Our stakeholders are friends to the group which on a regular basis do leisure time activities with friends and therefore are in need of a tool to help them plan their activities.

Scope

The primary goal is to develop a minimum viable product, that is a mobile application that displays activities near a user. The user should have the ability to host activities where both friends and strangers can join. Furthermore, the user should have the option to personalize their profile, for example add a profile picture and add favorite activities. A user should also have the ability to contact the admins of other people's activities and choose to join them. Other features, such as map services in order to see all nearby activities, will hopefully be added later on in the project's development.
